TO: Douglas Dotson, Chemist
RAB2/Health Effects Division (7509C)

Executive Summary

A chronic dietary risk assessment was conducted using the Dietary Exposure Evaluation Model (DEEM-FCID, Version 1.30), which uses food consumption data from the USDA's Continuing Surveys of Food Intakes by Individuals (CSFII) from 1994-1996 and 1998. The analysis was performed to support Section 3 requests for tolerances for residues of boscalid on celery, spinach, and bananas. In addition, modifications are being made to the tolerances for strawberries, the tree nuts crop group (Group 14), and the rotational crop tolerances for garden beet roots, radish

(1)

roots, turnip roots, sugar beet roots and Crop Group 2 (the tops of root and tuber vegetables).

Chronic Dietary Exposure Results and Characterization

The chronic dietary exposure analysis was based on tolerance level residues and 100% crop treated assumptions. DEEM (Version 7.81) default processing factors were used for some commodities. As the general U.S. population and all population subgroups had risk estimates that were below HED's level of concern (i.e., 100% of the chronic population adjusted dose (cPAD)) it was not necessary to make further refinements to the analysis. As such, this analysis is a very conservative one. The cPAD for the most highly exposed population subgroup (Children 1-2 years) is 31% and the cPAD for the general U.S. population is 9.3%.

I. Introduction

Dietary risk assessment incorporates both exposure and toxicity of a given pesticide. For acute and chronic assessments, the risk is expressed as a percentage of a maximum acceptable dose (i.e., the dose which HED has concluded will result in no unreasonable adverse health effects). This dose is referred to as the population adjusted dose (PAD). The PAD is equivalent to the Reference Dose (RfD) divided by the special FQPA Safety Factor.

For acute and non-cancer chronic exposures, HED is concerned when estimated dietary risk exceeds 100% of the PAD. HED is generally concerned when estimated cancer risk exceeds one in one million (i.e., the risk exceeds 1×10^{-6}). References which discuss the acute and chronic risk assessments in more detail are available on the EPA/pesticides web site: "Available Information on Assessing Exposure from Pesticides, A User's Guide," 6/21/2000, web link: <http://www.epa.gov/fedrgstr/EPA-PEST/2000/July/Day-12/6061.pdf>; or see SOP 99.6 (8/20/99).

The most recent dietary risk assessment for boscalid was conducted by D. Dotson (D316141, 5/5/2005).

II. Residue Information

The first tolerances for boscalid were established in 40CFR §180.589 on July 30, 2003. These tolerances include those for primary crops, rotational crops, and livestock commodities. Additional tolerances were subsequently granted for pome fruit (PP#2F6434), hops (PP#2F6434), and soybeans (PP#3F6580). The tolerances for these commodities are: pome fruit (3.0 ppm), soybean seed (0.10 ppm), and hops (35 ppm). Finally, a temporary tolerance of 2.0 ppm has been established in conjunction with a Section 18 emergency exemption request for the use of boscalid on tangerines in California. For the current action, tolerances are being recommended for celery at 45 ppm, spinach at 60 ppm, and bananas at 0.20 ppm. In addition, the 1.2 ppm tolerance for strawberries currently in effect is being increased to 4.5 ppm. The rotational crop tolerance for garden beet roots, radish roots, turnip roots, sugar beet roots and Crop Group 2 (the tops of root and tuber vegetables) is also being reduced. The current tolerance

for these commodities is 1.0 ppm. The tolerance is being reduced to 0.10. Residues in drinking water are being included directly in the analysis. The estimated drinking water concentration was provided by EFED. It was derived from a Tier 1 FIRST assessment for use on turf. The chronic surface water concentration for use in the chronic dietary exposure analysis is 0.02577 ppm.

In target and rotational crops, the residue of concern for both the tolerance expression and risk assessment is parent boscalid. In livestock, the residues of concern for both the tolerance expression and risk assessment are the combined residues of boscalid as well as the free and conjugated hydroxy metabolites (M510F01 and M510F02). Tolerance level residues were used for all commodities. DEEM (Version 7.81) default processing factors (adjustment factor #1) were used for some commodities. Processing factors were used to modify the tolerances in four separate ways. For some commodities processing studies demonstrated that residues of boscalid do not concentrate. For these commodities the raw agricultural commodity (RAC) tolerance was used and adjustment factor #1 (the processing factor) was set to 1.000. For some commodities the processing studies demonstrated that there was a slight concentration of residues upon processing. In these cases, the tolerance for the RAC was adequate to cover residues in processed commodities. Adjustment factor #1 was set to 1.000. For some commodities, residues concentrated enough in the processing studies that separate tolerances were established for the processed commodities. These tolerances were used in the assessment and, again, adjustment factor #1 was set to 1.000. For the other processed commodities, for which data are not available, DEEM (Version 7.81) default processing factors were used. Table 1 below lists the processing factors used for the various processed commodities. One hundred percent crop treated was assumed for all commodities in this assessment.

Table 1. Processing Factors Used in Analysis

Residues Do Not Concentrate in Processed Commodity	Adj. #1*	Tolerance Level Adequate to Cover Slight Concentration (processing factor)	Adj. #1*	Separate Tolerance Established	Adj. #1*	DEEM (Version 7.81) Default Processing Factor	Adj. #1*
Apple Juice	1.0	Wheat Germ (1.2x)	1.0	Grape - Raisin	1.0	Potatoes - Dry (including flour)	6.5
Plum - Prune	1.0	Wheat Bran (1.2x)	1.0	Peanut Oil	1.0	Onions - Dry	9.0
Rice Bran	1.0	Tomato Paste (1.1x)	1.0			Tomatoes - Dried	14.3
Wheat Flour	1.0					Apple - Dried	8.0
Sunflower Oil	1.0					Pear - Dried	6.25
Mint Oil	1.0					Apricot - Dried	6.0
Tomato Puree	1.0					Peach - Dried	7.0

Table 1. Processing Factors Used in Analysis

Residues Do Not Concentrate in Processed Commodity	Adj. #1*	Tolerance Level Adequate to Cover Slight Concentration (processing factor)	Adj. #1*	Separate Tolerance Established	Adj. #1*	DEEM (Version 7.81) Default Processing Factor	Adj. #1*
Tomato Juice	1.0					Beef Meat - Dried	1.92
Soybean Oil	1.0					Peanut - Butter	1.89
						Tangerines - Juice	2.3
						Field Corn Syrup	1.5
						Bananas, Dried	3.9
						Plantains, Dried	3.9

* Adj. #1: Adjustment Factor # 1. The actual processing factor used in the processing factor column in the commodity contribution list (Attachment 1).

A review of the processing studies for the registered commodities (except apples and soybeans) can be found in the residue chemistry summary document that included the first established tolerances for boscalid (Memo, D278385, M. Nelson, 8/15/03). A review of the processing studies for apples and soybeans can be found in the residue chemistry summary document that included those commodities (Memo, D290185, D. Dotson, 2/10/04).

III. DEEM-FCID™ Program and Consumption Information

A boscalid chronic dietary exposure assessment was conducted using the Dietary Exposure Evaluation Model software with the Food Commodity Intake Database (DEEM-FCID™, Version 1.30), which incorporates consumption data from USDA's Continuing Surveys of Food Intakes by Individuals (CSFII), 1994-1996 and 1998. The 1994-96, 98 data are based on the reported consumption of more than 20,000 individuals over two non-consecutive survey days. Foods "as consumed" (e.g., apple pie) are linked to EPA-defined food commodities (e.g. apples, peeled fruit - cooked; fresh or N/S; baked; or wheat flour - cooked; fresh or N/S, baked) using publicly available recipe translation files developed jointly by USDA/ARS and EPA. For chronic exposure assessment, consumption data are averaged for the entire U.S. population and within population subgroups, but for acute exposure assessment are retained as individual consumption events. Based on analysis of the 1994-96, 98 CSFII consumption data, which took into account dietary patterns and survey respondents, HED concluded that it is most appropriate to report risk for the following population subgroups: the general U.S. population, all infants (<1 year old), children 1-2, children 3-5, children 6-12, youth 13-19, adults 20-49, females 13-49, and adults 50+ years old.

4

For chronic dietary exposure assessment, an estimate of the residue level in each food or food-form (e.g., orange or orange juice) on the food commodity residue list is multiplied by the average daily consumption estimate for that food/food form. The resulting residue consumption estimate for each food/food form is summed with the residue consumption estimates for all other food/food forms on the commodity residue list to arrive at the total average estimated exposure. Exposure is expressed in mg/kg body weight/day and as a percent of the cPAD. This procedure is performed for each population subgroup.

IV. Toxicological Information

The Health Effects Division's Hazard Identification Assessment Review Committee (HIARC) met on September 5, 2002 and January 23, 2003 to evaluate the toxicology database for boscalid (Report dated 3/7/03, TXR No. 0051613). The findings of the HIARC relative to dietary exposure are summarized in Table 2. No appropriate endpoint was identified for assessing acute exposures, and boscalid was given a carcinogen classification of "Suggestive evidence of carcinogenicity, but not sufficient to assess human carcinogenic potential." As such, only a chronic dietary analysis is required.

Table 2. Summary of Toxicological Doses and Endpoints for Use in Human Health Dietary Risk Assessment for boscalid (HIARC, 3/7/03, TXR No. 0051613)

Exposure Scenario	Dose Used in Risk Assessment, UF	Special FQPA SF* and Level of Concern for Risk Assessment	Study and Toxicological Effects
Acute Dietary	No appropriate endpoint identified	NA	NA
Chronic Dietary (All populations)	NOAEL = 21.8 mg/kg/day UF = 100 Chronic RfD = 0.218 mg/kg/day	FQPA SF = 1X cPAD = <u>chronic RfD</u> FQPA SF = 0.218 mg/kg/day	Chronic rat, carcinogenicity rat and 1-year dog studies LOAEL = 57-58 mg/kg/day based on liver and thyroid effects
Cancer	Classification: "Suggestive evidence of carcinogenicity, but not sufficient to assess human carcinogenic potential."		

V. Results/Discussion

As stated above, for chronic assessments, HED is concerned when dietary risk exceeds 100% of the cPAD. The DEEM-FCID™ analyses estimate the dietary exposure of the U.S. population and various population subgroups. The results reported in Table 3 are for the general U.S.

Population, all infants (<1 year old), children 1-2, children 3-5, children 6-12, youth 13-19, females 13-49, adults 20-49, and adults 50+ years.

The analyses summarized in Table 3 are based on tolerance-level residues (in some cases modified by DEEM (Version 7.81) default processing factors), and assume 100% crop treated. Even with these highly conservative assumptions, the risk estimates are below HED's level of concern. The most highly exposed population subgroup is children 1-2 years, which utilizes 31% of the cPAD. The general U.S. population utilizes 9.3% of the cPAD.

Table 3. Summary of Dietary Exposure and Risk for Boscalid

Population Subgroup	Acute Analysis	DEEM: Chronic Analysis		Cancer Analysis
		Dietary Exposure (mg/kg/day)	% cPAD	
General U.S. Population	Not Applicable: No Acute Dietary Endpoint	0.020202	9.3	Not Applicable: No cancer risk assessment is required
All Infants (< 1 year old)		0.047013	22	
Children 1-2 years old		0.067046	31	
Children 3-5 years old		0.046987	22	
Children 6-12 years old		0.024451	11	
Youth 13-19 years old		0.013912	6.4	
Adults 20-49 years old		0.015423	7.1	
Adults 50+ years old		0.017092	7.8	
Females 13-49 years old		0.015606	7.2	

VI. Characterization of Inputs/Outputs

The assumptions made in this assessment are conservative ones and HED is confident that this analysis does not underestimate risk to the general U.S. population or any population subgroup.

VII. Conclusions

Based on highly conservative assumptions, dietary risk estimates to boscalid do not exceed HED's level of concern for the general U.S. population or any population subgroups, including those comprised of infants and children.

Attachment 2: Results of Chronic Dietary Exposure Analysis

U.S. Environmental Protection Agency
DEEM-FCID Version 2.03; 1994-96 data with 1998 Supplemental Children's Survey

Chronic NOAEL: 2.18 mg/kg bw/day

Population Adjusted Dose (PAD, Chronic): 0.218 mg/kg bw/day

Residue file name: C:\DEEMFCID\Boscalid\Boscalid.R98

Adjustment factor #2 NOT used.

Analysis Date 11-02-2005/09:29:21 Residue file dated: 11-02-2005/09:27:05/8

COMMENT 1: The FQPA Safety Factor is 1; therefore, the RfD = the PAD

Total exposure by population subgroup

Total Exposure		
Population Subgroup	mg/kg body wt/day	Percent of PAD
U.S. Population (total)	0.020202	9.3%
U.S. Population (spring season)	0.020235	9.3%
U.S. Population (summer season)	0.019746	9.1%
U.S. Population (autumn season)	0.020325	9.3%
U.S. Population (winter season)	0.020517	9.4%
